

Java - Loops & Conditions (Short Explanation)

For Loop

Repeats code for a fixed number of times.

```
for(int i=1;i<=5;i++){  
    System.out.println(i);  
}
```

Useful for counters, ranges, arrays.

Practice: Print sum of 1–100.

Enhanced For Loop

Used to iterate through arrays and collections.

```
int[] arr={10,20,30};  
for(int x:arr){  
    System.out.println(x);  
}
```

Automatically retrieves each element; no index needed.

Practice: Print all names in a string array.

If-Else

Used to compare values or conditions.

```
if(n>10)  
    System.out.println("Greater");  
else  
    System.out.println("Smaller");
```

Executes true block or runs else if condition is false.

Practice: Check whether number is odd or even.
